                                                                                                  à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human novel polypeptides and their associated polynucleotides. The polypeptides and polynucleotides are useful in gene therapy for treating, inhibiting or preventing neural disorders, immune system disorders (e.g. respiratory diseases (e.g. and multiple sclerosis), muscular disorders, respiratory diseases (e.g. card nestibulitis, nasal polyps and sinusitis), reproductive disorders, cardiovascular disorders (e.g. congenital heart defects, Ebstein's anomaly and hypoplastic left heart syndrome), renal disorders (e.g. acute kidney failure and end-stage renal disease), hyperproliferative disorders (e.g. Hodgkin's disease and appendicitis), allergic reactions and conditions (e.g. asthma), blood related disorders (e.g. thrombosis, atherosclerosis and myocardial infarction) and cancerous diseases. Sequences ABU54914-ABU55699 and infarction) and cancerous diseases. Sequences ABU54914-ABU55699 and ABU55748 represent human novel polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       or

and

The invention relates to isolated nucleic acids and proteins are used to encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunosassays e.g. radioimmunosassays or enzyme linked immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrals and fungi and coular disorders e.g. corneal infection, bacteria, viruses and fungi and coular disorders e.g. corneal infection, and many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell to protein, carbohydrate, virumins, capabilities, fat content, lipid, protein, carbohydrate, virumins, minerals, cofactors and other nutritional components. The printed sequence data for this patent did not form part of the printed

renting c s, plate seases or New polynucleotide and polypeptide useful for diagnosing, prevtreating conditions such as neurodegenerative diseases, anemia disorders, wounds, burns, ulcers, osteoporosis, autoimmune dis

1185pp; English 757; ID NO SEQ ;; ; Claim The invention relates to 971 novel human CDNA sequences (ADC29919-CC ADC30899) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a mucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention dentifying a compound which binds to a polypeptide of the invention. The invention and invention and invention in methods of the invention in methods for the identification of compounds that modulate the invention; methods for the identification of compounds that modulate the invention; methods for the polymucleotide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention of ADC33627) and the polypeptides encoded by the contigs (ADC33628 ADC3361). The nucleic acids and polypeptides of the invention are traits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or conting and other recombinant production of a protein. The polypeptides and as food supplements. The present sequence represents a specifically claimed human cDNA sequence of the printed specification, but was are also obtained in electronic format directly from WIPO at the polypeptides.

                                                                                             h factor; DEC2; DEC1;
differentiation; proliferat
                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a basic helix loop helix (bHLH) transcription factor designated DEC2. DEC2 can be used as a tool development of drugs for the treatment and prevention of disorde involving cell differentiation and proliferation. The present sencodes the specifically claimed human DEC2a protein, as given i present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .;

The present invention relates to a new method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing ovarian cancer (e.g. patients having a familial history of ovarian cancer). The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and viral meningitis, Alzheimer's disease or parkinson's disease), brain comparing nseful S Kovatis S ), Mills Assessing whether a patient is afflicted with ovarian cancer, assessing the stage or progression of the disease, comprises of the expression level of a cancer marker in a sample from a pat from a non cancer patient.                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel isolated polynucleotide. The polynucleotides of the invention have cytostatic activity, and may have suse in gene therapy, and in a vaccine. The composition and methods are useful in diagnosing and/or treating cancer, particularly ovarian cancer. The composition may also be used as a vaccine to prevent cancer. The

The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polynucleotides of the invention.

The invention describes a new isolated polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful as therapeutics, polypeptide, nucleic acid and antibody are useful as therapeutics, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NOVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating the disease or condition. In particular, the NOVX polypeptide or polynucleotide is useful for treating endocrine/ metabolism-related diseases (e.g. obesity or diabetes), central nervous system disorders (e.g. Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, schizophrenia or depression), autoimmune asthma, inflammatory bowel disease, rheumatoid atthritis or astociaming casthma, inflammatory bowel disease, rheumatoid atthritis or osteoarthritis), cancers (e.g. colon, lung, liver, breast, ovarian, osteoarthritis), lung diseases (e.g. colon, lung, liver, breast, ovarian, cirrhosis), lung diseases (e.g. colon, lung, liver diseases (e.g. liver cirrhosis), lung diseases (e.g. viral, bacterial or parasitic). These are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications, and for monitoring the effects of drugs during clinical trials. This sequence encodes a novel human NOV protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0

9 designated NOVX, useful for treating of obesity, dyslipidemia, anorexia, and e, immune and hematopoietic disorders. Novel isolated polypeptide, de preventing cancer, diabetes, metabolic, neurodegenerative,

English 421pp; 43-44; Page <u>ი</u> Claim

The invention relates to an isolated polypeptide, designated NOVX, comprising a sequence fully defined in the specification. The isolated protein, its encoding polynucleotide or an antibody created from the protein, its encoding polynucleotide or an antibody created from the protein is useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NoVX-associated disorder, or for treating or preventing a NOVX-associated disorder, or for treating or preventing metabolic disorders, diabetes, obssity, infectious disease, anorexia, neurodespenerative disorders, also useful for infectious disease, and various dyslipidaemias, metabolic disturbances associated with obesity, the metabolic syndrome X, wasting disorders associated with chronic diseases, and cancer. The isolated protein are useful for treating or preventing neurological disorders such as epilepsy, stroke, with obesity, the metabolic syndrome X, wasting disorders associated with cholynucleotide or an antibody created from the protein are useful for treating or preventing neurological disorders such as epilepsy, stroke, mental disorders including mood, anxiety, schizophrenic disorders, disorders of vesicular transport such as cystic fibrosis, diabetes mental disorders allergic reactions, multiple solerosis and rheumacoid arthritis. A cell comprising the vector of the invention is useful for producing non-human transgenic animals. The polynucleotide of the invention can be used to treat disorders by gene therapy. This invention of the invention of the invention of the isolated work. ated with invention the of Se NOVX proteins

The present invention relates to a microarray comprising a matrix of at least one cDNA probe from a set of probes immobilised to a solid surface in a predetermined order, where a row of pixels corresponds to replicates of one distinct probe from the set. The probes are complementary to nucleic acid sequences that are expressed differentially in aggressive as compared to non-aggressive types of clear cell renal carcinoma (CC-RCC) and that hybridise to the probes under high stringency conditions. The microarray is useful for the prognosis of patients with CC-RCC, wherein aggressive and non-aggressive CC-RCC tumour types are characterised by differential expression profiles of genes that hybridise with one or more probes immobilised on the microarray. The arrays are useful for gene expression profiling of tumour and normal tissues. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                               New microarray, comprising a matrix of cDNA probe from a set of probes immobilized to a solid surface in predetermined order, useful in the prognosis of patients with clear cell renal carcinoma.

```
The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunosassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, angiogenesis, nervent system disorders e.g. cerebral ischaemia, angiogenesis, nervent system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and coular disorders e.g. corneal infection, and many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The printed sequence encodes a novel secreted protein of the invention. Note: The sequence data for this patent did not form part of the printed

The invention relates to human novel polypeptides and their associated polynucleotides. The polypeptides and polynucleotides are useful in gene therapy for treating, inhibiting or preventing neural disorders, immune system disorders (e.g. systemic lupus erythematosus, rheumatoid arthritis and multiple sclerosis), muscular disorders, respiratory diseases (e.g. and multiple sclerosis), muscular disorders, cardiovascular disorders, cardiovascular disorders, cardiovascular disorders (e.g. congenital heart defects, Ebstein's anomaly and hypoplastic left heart syndrome), renal disorders (e.g. acute kidney failure and end-stage renal disease), hyperproliferative disorders (e.g. Hodgkin's disease and leukaemia), inflammatory diseases (e.g. septic shock, bursitis and appendicitis), allergic reactions and conditions (e.g. asthma), blood related disorders (e.g. thrombosis, atherosclerosis and myocardial infarction) and cancerous diseases. Sequences ABX73173-ABX74167 represent human novel polynucleotides of the invention
                                                                                                                                                           New polypeptides and nucleic acids, useful in gene therapy for treating inhibiting or preventing e.g. neural, immune system, muscular, respiratory, reproductive, gastrointestinal, pulmonary, cardiovascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TTGCAATACCTCTCCCGGTTTGAGAGCTGGACACCCAGGGAGCCGCGGTGTGTCCAGCTGTTCAGCTGTTCAGCTGTTCAGCTGTTTGAGAGCTGGACACCCAGGGAGCCGCGGGTGTGTCCAGCTGTTTGAGAGCTGGACACCCAGGGAGCCGCGGGTGTGTCCAGCTG

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosting a pathological condition or susceptibility to a set of pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunosasays e.g. radioimmunosasays or enzyme linked immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiox arrest, carebral ischaemia, angiogenssis, neoplasms of the breast or liver, cardiovascular disorders e.g. carebral ischaemia, angiogenssis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection, and many other disorders e.g. Alzheimer's disease, infections caused to be used to aid wound healing and epithalial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The primted sequence encodes a novel secreted protein of the printed the printed

                                                                                                                                                                        ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human novel polypeptides and their associated polynucleotides. The polypeptides and polynucleotides are useful in gene therapy for treating, inhibiting or preventing neural disorders, immune system disorders (e.g. systemic lupus erythematosus, rheumatoid arthritis and multiple sclerosis), muscular disorders, respiratory diseases (e.g. and multiple sclerosis), muscular disorders, respiratory diseases (e.g. congenital heart defects, Ebstein's anomaly and hypoplastic left heart syndrome), renal disorders (e.g. acute kidney failure and end-stage renal disease), hyperproliferative disorders (e.g. Hodgkin's disease and leukaemia), inflammatory diseases (e.g. septic shock, bursitis and appendicitis), allergic reactions and conditions (e.g. asthma), blood related disorders (e.g. thrombosis, atherosclerosis and myocardial infarction) and cancerous diseases. Sequences ABX73173-ABX74167 represent human novel polynucleotides of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                          The invention describes a new isolated polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful as therapeutics, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NOVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating the disease or condition. In particular, the NOVX polypeptide or polymucleotide is useful for treating endocrine/ metabolism-related diseases (e.g. obesity or diabetes), central nervous system disorders (e.g. psoriasis, allergy, lupus erythematosus, epilepsy, multiple sclerosis, schizophrenia or depression), autoimmune and inflammatory disorders (e.g. psoriasis, allergy, lupus erythematosus, esteoarthritis), cancers (e.g. colon, lung, liver, breast, ovarian, casthma, inflammatory bowel disease, rheumatoid arthritis or osteoarthritis), lung diseases (enghysease in the colon, lung, liver diseases (e.g. liver, prostate or brain cancers, or melanoma), liver diseases (e.g. liver, cirrhosis), lung diseases (emphyseme or obstructive pulmonary disease), haemophilia, stroke, or infections (e.g. viral, bacterial or parasitic). These are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic trials. This sequence encodes a novel human NOV protein
                                                                                                                                                                                                                                                                                                                                                                      ö

The invention comprises compositions used for the therapy and diagnosis of ovarian cancer. The compositions comprise one or more ovarian tumour proteins, their associated polynucleotides, or immunogenic portions of the proteins. The ovarian tumour polynucleotides and polypeptides are useful for stimulating and/or expanding T cells specific for a tumour protein. They are also useful for inhibiting the development of cancer in a patient with an ovarian tumour DNA or protein by incubating isolated T-cells allowing them to proliferate, and administering to the patient. The sequences can be used as markers for cancer, for example, to monitor ovarian cancer progression. Probes and primers are useful in nucleic acid hybridisation, in detecting the presence of complementary sequences in a given sample, for preparing mutant species and for preparing other genetic constructions. Sequences AAS23820-AAS25231 and AAS25328-AAS25549 represent human ovarian tumour protein cDNA clones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GGATGC

Quality

tγ

Qualit

only cof CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are c sequenced and submitted once, so the sequence for the remainder the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.

searches, and 550) s GDB,

--- E081 --- E263 --- E2

P. Green and

BLAST the are not by E led by -34) to exons ANNOTATION OF FEATURES:

STSs are identified using ePCR (Genome Res. 7:541-550)

of a local database that includes entries from dbSTS, GDB, local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34)

EST and cDNA sequences. Genes demonstrate at least two exo flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are identical matches are annotated as similar. SEQUENCING READ COVERAGE: Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found

Assessing whether a patient is afflicted with ovarian cancer, useful in assessing the stage or progression of the disease, comprises comparing the expression level of a cancer marker in a sample from a patient and from a non cancer patient.

186-187; 481pp; English. Disclosure; Page

The present invention relates to a new method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as particular use with patients having an enhanced risk of developing ovarian cancer. The cancer markers may be used in the management and treatment of e.g. patients having a familial history of ovarian cancer. The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. brain and central nervous system disorders (e.g. bacterial or viral meningitis or encephalitis), testicular disorders (e.g. bacterial or viral meningitis or encephalitis), testicular disorders (e.g. nontuberculous granulomatous orchitis), testicular cancer, monitoring the progression of ovarian cancer, determining whether ovarian cancer has metastasized or is likely to metastasize, selecting a composition for inhibiting ovarian cancer, assessing the ovarian cancer as selecting a composition of a compound, or inhibiting ovarian cancer cancer or at risk of developing ovarian cancer. The present nucleic acid sequence encodes one of the ovarian cancer markers described in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 300
                                                                                                                                                                                                                                                                                                 Ø
                                                                                                                                                                                                                                                                                      The invention relates to a novel isolated polynucleotide. The polynucleotides of the invention have cytostatic activity, and may have use in gene therapy, and in a vaccine. The composition and methods are useful in diagnosing and/or treating cancer, particularly ovarian cancer. The composition may also be used as a vaccine to prevent cancer. The present sequence is used in the exemplification of the invention

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with invention also relates to nucleic acid of the invention; the crecombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of upolymuleotides or polypeptides of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of peventing, treating or ameliorating a medical condition; kits comprising polymuleotide probes invention; methods for the identification of compounds that modulate the analyor monoclonal antibodies for carrying out the methods of the invention or activity of the polymuleotide and/or polypeptide; and 767 cantig sequences corresponding to the coMA sequences of the invention are corresponding to the coMA sequences of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the invention of mutations responsible for general diseases or their and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alaheimer's discusse and other neurodegenerative diseases, and in the recombinant production of a protein. The polypeptides of the protein of a protein. The polypeptides of a protein. The polypeptides of the invention are used for treating diseases, and and an and in the recombinant production of a protein. The polypeptides

The invention relates to an isolated polypeptide, designated NOVX, comprising a sequence fully defined in the specification. The isolated protein, its encoding polymucleotide or an antibody created from the protein, its useful in the manufacture of a medicament for treating a syndrome associated with a human diseasent by NOVX-associated disorder, or for treating or preventing a NOVX-associated disorder in a subject, preferably human. The isolated protein, its encoding polynucleotide or an antibody created from the protein are also useful for treating or preventing metabolic disorders, diabetes, obesity, infectious disease, and various disorder; immune disorders, haematopoletic disorders associated disorders, and various dyslipidaemias, metabolic disturbances associated with obesity, the metabolic syndrome X, wasting disorders associated with obesity, the metabolic syndrome X, wasting disorders associated with choseity, the metabolic syndrome X, wasting disorders associated with antibody created from the protein are useful for treating or preventing neurological disorders such as espilepsy, stroke, mental disorders including mood, anxiety, schizophrenic disorders, disorders of vesicular transport such as cystic fibrosis, diabetes mellitus, other conditions associated with abnormal vesicle trafficking including AIDS, allergic reactions, multiple sclerosis and rheumatoid architis, other conditions associated with abnormal vesicle trafficking including AIDS, allergic reactions, multiple sclerosis and rheumatoid architis. A cell comprising the vector of the invention is useful for producing non-human transgenic animals. The polynucleotide of the invention and be used to treat disorders by gene therapy. This polynucleotide sequence represents the DNA encoding one of the isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1141
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1021

(NOVX) New cytoplasmic, nuclear membrane bound or secreted polypeptides (NO' and polynucleotides, useful in gene therapy, e.g. for treating or preventing obesity, multiple sclerosis, allergy, cancers, hemophilia stroke or infections.

20; Page 125; 586pp; English Claim

The invention describes a new isolated polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful as therapeutics, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NOVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating the disease or condition. In particular, the NOVX polypeptide or polynucleotide is useful for treating endocrine/

                                                                                                                                                                                                                                                                                    181
                                                                                                                                                                                                                                                                                                                 241
                                                                                                            The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic activity

The present invention relates to a microarray comprising a matrix of at least one cDNA probe from a set of probes immobilised to a solid surface in a predetermined order, where a row of pixels corresponds to replicates of one distinct probe from the set. The probes are complementary to nucleic acid sequences that are expressed differentially in aggressive as compared to non-aggressive types of clear cell renal carcinoma (CC-RCC) and that hybridise to the probes under high stringency conditions. The microarray is useful for the prognosis of patients with CC-RCC, wherein aggressive and non-aggressive CC-RCC tumour types are characterised by differential expression profiles of genes that hybridise with one or more probes immobilised on the microarray. The arrays are useful for gene expression profiling of tumour and normal tissues. The present sequence represents a human cDNA sequence up-regulated in CC-RCC patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     of probes in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ACTCTGGGACATCTGGAGAAAGCTGTAGTCTTGGAATTAACTTTGAAACACTTAAAAGCT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel method for detecting soft tissue sarcomy which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue

                                                                                                                                                   ð
                                                                                                                                                                                      concided secreted proteins. The nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a latenological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (EDISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrovassular disorders e.g. carebral isohaemia, angiogenesis, cerebrovassular disorders e.g. carebral isohaemia, angiogenesis, arrest, cerebrovassular disorders e.g. cerebral isohaemia, angiogenesis, can also be used to aid wound healing and epithelial cell proliferation, and many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, cransplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotraxis. The polypeptides can also be used content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The princesent sequence encodes a novel secreted protein of the invention. Note: The sequence encodes a novel secreted protein of the printed.

```
The invention relates to human novel polypeptides and their associated polynucleotides. The polypeptides and polynucleotides are useful in gene therapy for treating, inhibiting or preventing neural disorders, immune system disorders (e.g. systemic lupus erythematosus, rheumatoid arthritis and multiple sclerosis), muscular disorders, respiratory diseases (e.g. and multiple sclerosis), muscular disorders, respiratory diseases (e.g. cand multiple sclerosis), pulmonary disorders, cardiovascular disorders (e.g. congenital heart defects, Ebstein's anomaly and hypoplastic left heart syndrome), renal disorders (e.g. acute kidney failure and end-stage renal disease), hyperproliferative disorders (e.g. Hodgkin's disease and appendicitis), allergic reactions and conditions (e.g. asthma), blood related disorders (e.g. thrombosis, atherosclerosis and myocardial infarction) and cancerous diseases. Sequences ABX73173-ABX74167 represent human novel polynucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               540

                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel isolated polynucleotide. The polynucleotides of the invention have cytostatic activity, and may have use in gene therapy, and in a vaccine. The composition and methods are useful in diagnosing and/or treating cancer, particularly ovarian cancer. The composition may also be used as a vaccine to prevent cancer. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                           diagnosing and/or treating vaccine.

The invention describes a new isolated polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful as therapeutics, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NOVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating to reating the protein is useful in gene therapy for treating to reating endocrine, polypeptide or polynucleotide is useful for treating endocrine, metabolism-related diseases (e.g. obesity or diabetes), central nervous system disorders (e.g. Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, schizophrenia or depression), autoimmune and inflammatory disorders (e.g. posciasis, allergy, lupus erythematosus, asthma, inflammatory bowel disease, rheumatoid arthritis or osteoarthritis), cancers (e.g. colon, lung, liver, breast, ovarian, prostate or brain cancers, or melanoma), liver diseases (e.g. liver cirrhosis), lung diseases (e.g. viral, bacterial or parasitic). These are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications, and for monitoring the effects of drugs during clinical trials. This sequence encodes a novel human NOV protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                  Clone distribution: MGC clone distribution information can
through the I.M.A.G.E. Consortium/LLNL at: http://image.l.
Series: IRAL Plate: 42 Row: f Column: 3
This clone was selected for full length sequencing because
passed the following selection criteria: GenomeScan gene
prediction.
Email: cgapbs-r@mail.nih.gov
Tissue Procurement: ATCC
cDNA Library Preparation: Rubin Laboratory
cDNA Library Arrayed by: The I.M.A.G.E. Consortium (LLNL)
DNA Sequencing by: Genome Sequence Centre,
BC Cancer Agency, Vancouver, BC, Canada
